Maximize Data Capture with iA Terminal

Copy, Scan and Fax Cost Capture Made Easy with Touch Screen Technology The iA Integrated Terminal is simple to use and with its touch screen capabilities, infinitely more user-friendly than traditional keyboard entry devices. The graphical user interface is browser-like and intuitive to deliver unprecedented staff acceptance. Other features include a large color LCD with touch screen capabilities for navigation, option selection and on-screen numeric keypad entry, as well as a full size QWERTY keyboard. Copier, scan and fax data capture can be made even easier with one-touch account selection.

One Terminal, Multiple Configurations The iA Integrated Terminal is available in many different configurations. A single Terminal can be configured to simultaneously control two fully featured MFDs, copiers and/or fax machines to save implementation costs and space and allow users to easily make simultaneous use of all the attached equipment.

The slimline, ergonomic iA Terminal can be bench or wall-mounted for elegant and practical installation. A screen tilt adjustment mechanism allows the terminal to be mounted at the optimal viewing angle regardless of installation height and lighting.

Quick and Easy Account Code Assignment for Copy, Scan and Fax Jobs The intuitive user interface makes it easy for the user to rapidly find the right account code and an "Account Recall" list—shared among all nQueue Billback modules—makes it even easier. For example, if a staff member has just created an account code at a local printer, that account code will be at the top of the "Account Recall" list shown on the iA Terminal when that user logs on.

Increased Efficiency The iA Integrated Terminal is designed to optimize efficiency throughout the firm.

- The on-screen display of a configurable number of recent chargeable account codes for one-touch selection saves users time.
- Sophisticated search functionality allows simple or complex searches to be performed easily.
- An Override option can be used when an account code has not yet been created within the accounting system. The transaction is then processed as an exception and the user is notified to assign an account code by email.

Deployment and Technical Functionality iA Terminals are LAN and WAN-connectable devices that use standard TCP/IP communication protocols. Terminals in remote offices can be connected to the nQueue Billback iA Platform via a WAN.

The architecture of the iA Integrated Terminal allows for software updates and enhancements to be downloaded remotely via the LAN or WAN. This simplifies the rollout of new functionality to the terminals and ensures that firms always have access to the latest terminal capabilities.

iA Terminal readily accommodates dual-line fax machines and both G3 and Super G3 fax transmission speeds.
